Eureka! After School Program

Skittles Activity Worksheet

(A) We just discussed three common ways to summarize **data** in science: **mean, median,** and **mode.** You have each been given a bag of Skittles. Sort your candies by **flavor (color)**, then count how many individual candies each flavor has.

Your bag of skittles:

Skittle Color	Red	Orange	Yellow	Green	Purple
# of candies					

(B) You'll notice that not every flavor has equal numbers of candies. Or maybe they do? Next, we'll see **if your classmates' Skittle bags are like yours.** The instructor will ask your classmates how many candies of each color they have. **Make sure to write this data down in the datasheet below:**

Classmate's Name	Red	Orange	Yellow	Green	Purple
Your data from (A)					

(C) Once everyone has shared their data, you will now be able to practice calculating **mean, median,** and **mode** by yourself! Your instructor will assign you a flavor (color) of Skittles. Using the datasheet from part (B), calculate **mean, median,** and **mode for the flavor you were assigned.**

Assigned flavor (color): ________________________________
Mean: _________________
Median: _________________
Mode: _________________

Use this space to show your work, if needed:

D) Once everyone has finished part (C), write down the results here:

	Red	Orange	Yellow	Green	Purple
Mean					
Median					
Mode					

E) Is every bag of Skittles the same? Compare your data from part (D) to your original bag of Skittles in part (A). How similar is your bag to everyone else's?
